## Executive summary

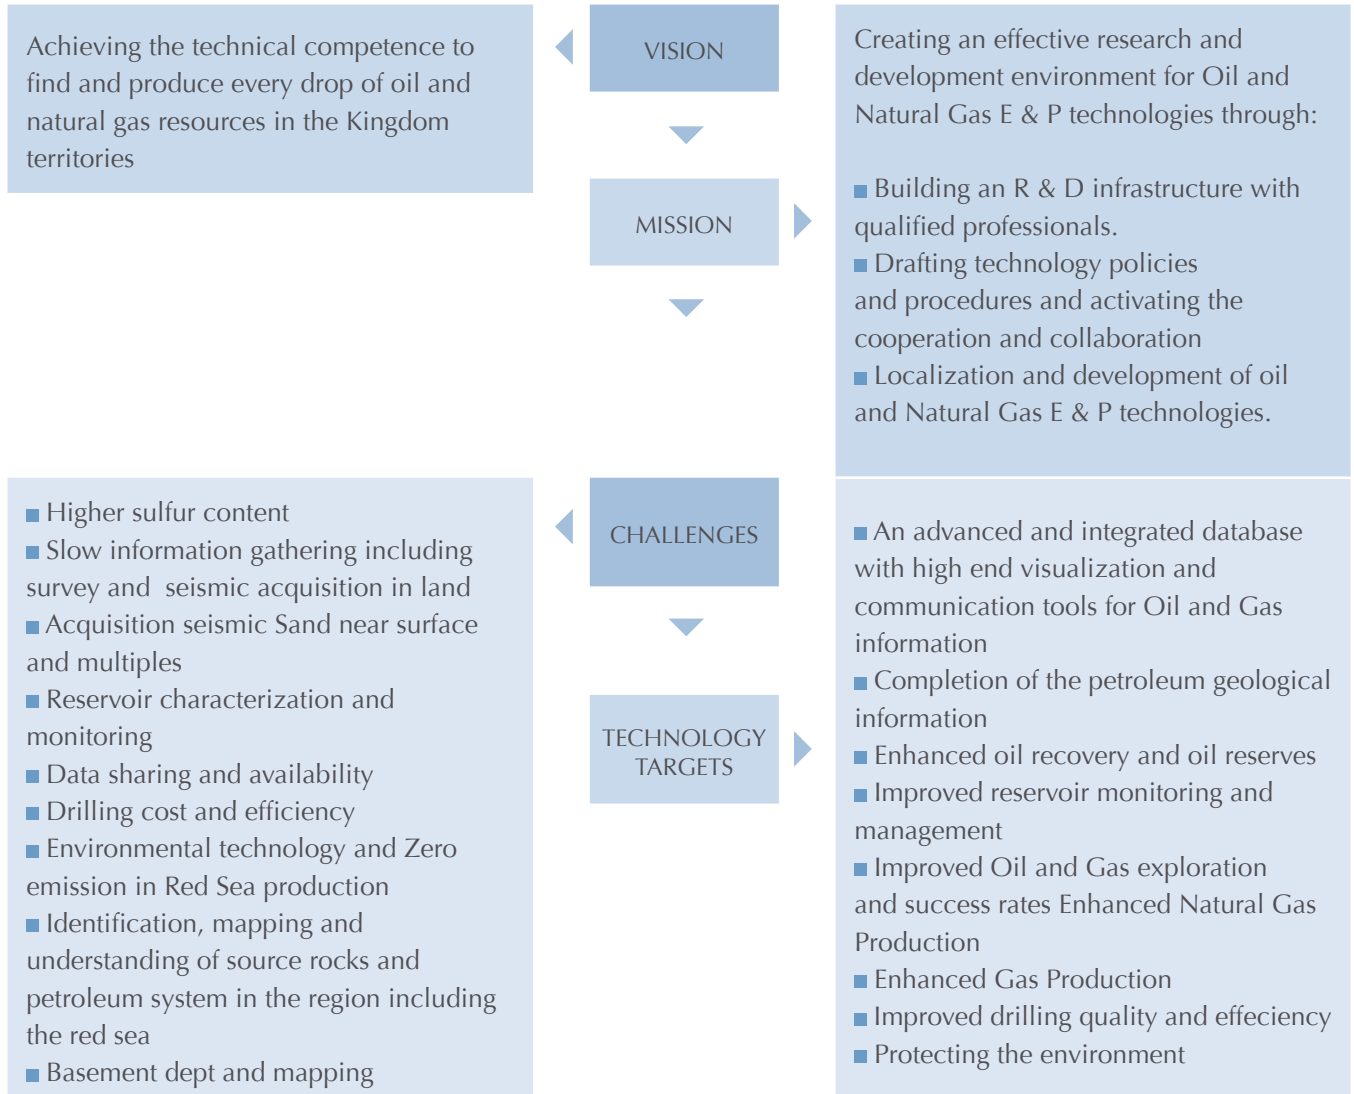

This document outlines a strategy that will guide oil and gas research and development in the Kingdom of Saudi Arabia for the next twenty years. Its development required the cooperation of many stakeholders in the exploration and production industry. These stakeholders helped to establish a vision, a mission, values, and strategic objectives that will focus oil and gas research and development in the Kingdom. Each of the strategic objectives

has a set of performance measures that will help gauge the success of the Kingdom in implementing this strategy.

Technology target areas were defined using a strengths, weaknesses, opportunities, and threats (SWOT) analysis. This analysis took inputs from many professionals representing nearly all of the oil and gas companies and universities in the Kingdom of Saudi Arabia. These individuals helped define the technology target areas by outlining the challenges that the Kingdom faces and expects to face in the future.

Figure 1 shows the vision, mission, challenges, and resulting technology target areas. For each technology target area, groups of professionals were selected to carry out more detailed planning.

Figure 1: Vision, Mission, Challenges, and Technology Target Areas

In order to ensure the successful implementation of this strategy, a system was designed to monitor its implementation and to allow for periodic updates. All components of this strategy are aimed at creating

value within the Kingdom and the vision is to excel in technologies that will help discover and produce every drop of oil and gas within the Kingdom of Saudi Arabia in an environmentally friendly manner.

## Introduction

The development of this strategic plan began following the approval of a national plan for science and technology in the Kingdom of Saudi Arabia (KSA). The King Abdulaziz City of Science and Technology (KACST) was directed to manage this national plan and it covered many different technology areas. Specifically, the plan focused on 11 strategic and advanced technologies ranked in the order of their importance. Oil and gas was ranked

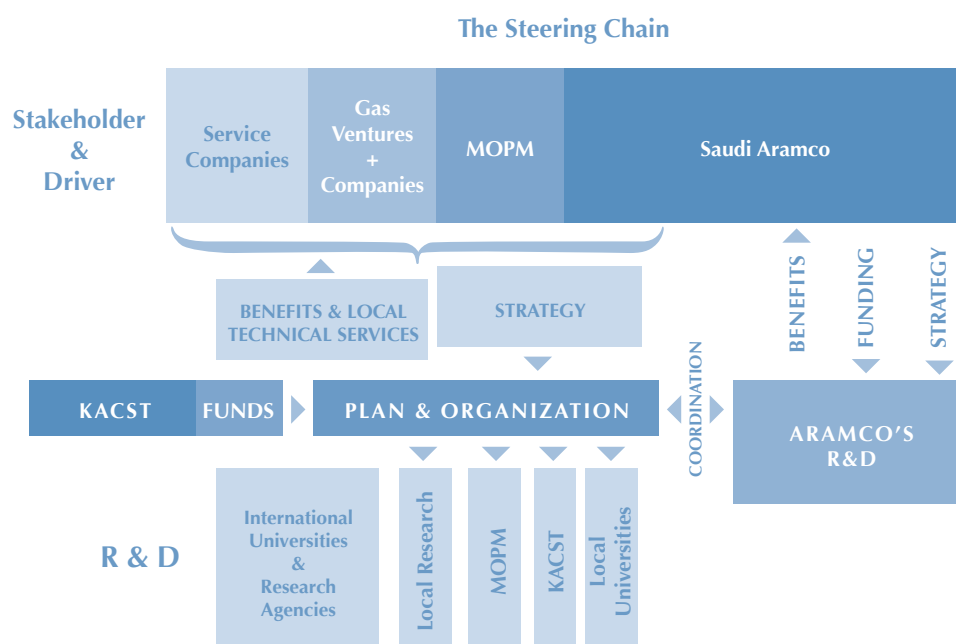

second, emphasizing its importance to the future of the Saudi economy.

## Stakeholders

Many stakeholders were involved in the development of this strategic plan. Key stakeholders include Saudi Aramco, the Ministry of Petroleum and Mineral Resources (MoPM), gas ventures, and service companies

for upstream oil and gas sectors. The planning process provided all stakeholders with an opportunity to share their ideas. Figure 2 is a schematic showing the relationships among the stakeholders.

Figure 2: Relationships among Oil and Gas Stakeholders

## Introduction

To encourage stakeholder participation, a website for the plan was constructed.

The website address is: <http://www.ept2025.com>

The oil and gas program formed a strategy team with representatives from Saudi Aramco, KACST, MoPM, and several universities. The team was responsible for

directing the development of the oil and gas strategic plan. The team met six times for a full day meetings and discussed a wide range of issues. The team also communicated with each other by e-mail and the chat room available at the plan web page. The strategy team is listed in table 1.

Table 1: Strategy Team

| Name                   | Institution                                      | Position           |
|------------------------|--|--------------------|
| Tariq AlKhalifah       | KACST  | Director           |
| Abdulrahman AlQuraishi | KACST  | Assistant Director |
| Abdulaziz AlKaabi      | Saudi Aramco                                     | Member             |
| Saleh Almulhim         | Saudi Aramco                                     | Member             |
| Iessa Mahfis           | MOPM, Eastern Branch                             | Member             |
| Majed Badah            | MOPM, Eastern Branch                             | Member             |
| Abdulaziz AlMajed      | King Fahad University for Petroleum and Minerals | Member             |
| Abdulaziz ibn Laboun   | King Saud University                             | Member             |
| Emad AlHomadhi         | King Saud University                             | Member             |
| Hassan Naji            | King Abdulaziz University                        | Member             |
| Mahmoud AlOsaimi       | MOPM, headquarter                                | Member             |
| Abdullah AlSabti       | KACST  | Project Manager    |
| Emad AlMushaigh        | KACST  | Team Secretary     |

### Strategy Development

The strategy development process began with a review of the oil and gas R&D experiences of technologically

mature countries such as Norway and Canada. Some of the references analyzed in this review are shown in Figure 3.

Figure 3: Oil and Gas Strategy References

Following a review of other countries initiatives, the status of oil and gas R&D in the Kingdom of Saudi Arabia was analyzed. SRI international was contracted to benchmark worldwide institutions in upstream oil and gas and to provide an analysis of the relative standing of the KSA in oil and gas R&D as measured by publications and patents status.

The oil and gas program next carried out a strengths, weakness, opportunities, and threats (SWOT) analysis. The program distributed a questionnaire requesting information on strengths, weakness, opportunities, and threats to a large number of professionals in the Kingdom. A workshop was then held dedicated to the

SWOT analysis. The head of the Norwegian Oil and Gas technology strategy (OG21) attended this workshop to provide additional insights based on their experience.

This workshop included more than 40 people representing nearly all companies, research institutes, and universities working in upstream oil and gas R&D in Saudi Arabia. Later, an additional questionnaire was distributed to specify the latest technologies and projects needed for the kingdom.

This was followed by another workshop that defined the technology target areas of importance and discussed the attendees willingness to participate in technology target

## Introduction

groups responsible for preparing the detailed technology target areas plans.

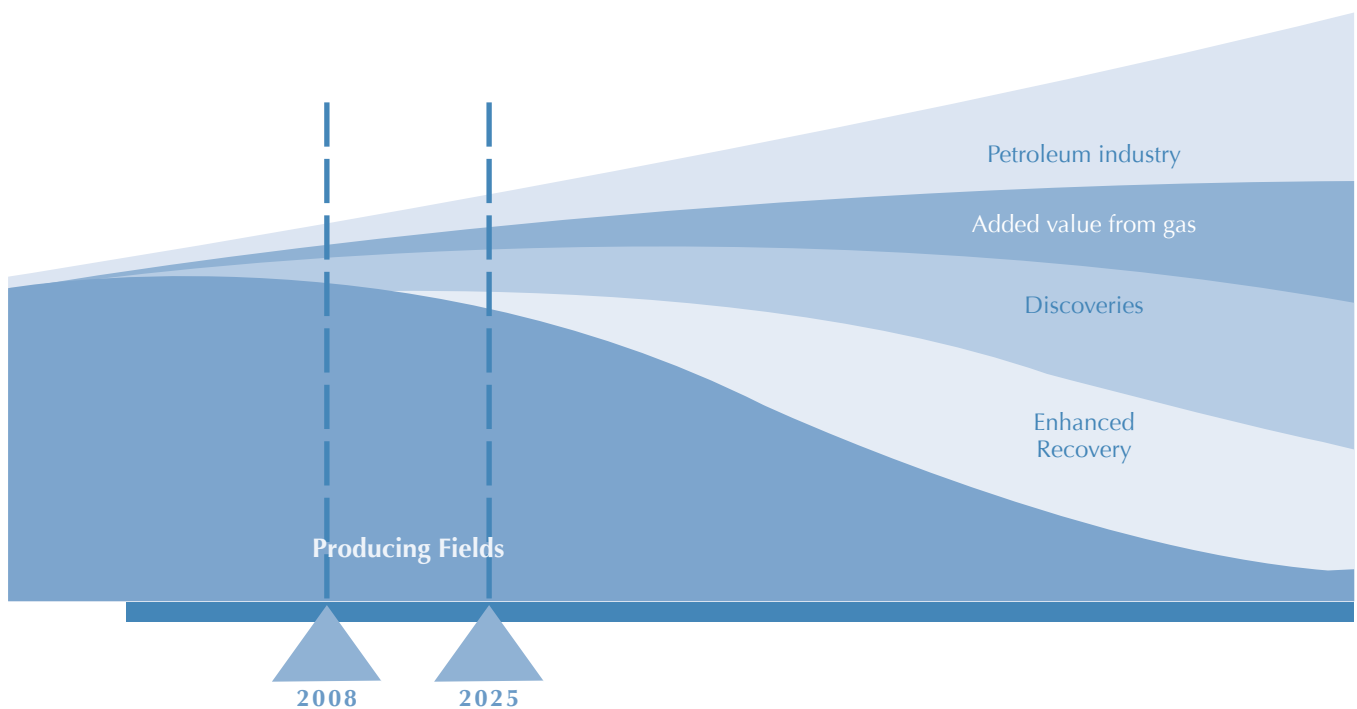

This process led to the development of this document, which outlines the strategy for upstream oil and natural gas technology development and localization. This strategic plan describes the initiatives needed to achieve the strategic goals and discusses the implementation process of the plan.

### Strategy Timeframe

Although this strategy concentrates on the next 20 years,

this plan develops a vision for the next 100 years. It is important to look out this far because, as shown in Figure 4, value from oil and gas production will diminish without the added value from enhanced recovery, new discoveries of oil and natural gas, and the supporting industry. New technologies supporting these potential added values include focusing efforts on the refining and petrochemical industries as we expect that Saudi Arabia will dominate the oil business for a significant period of time to come. However, refining and petrochemicals R&D is covered by another strategy that was developed by the petrochemical institute at KACST.

Figure 4: Future Challenges as Value from the Oil and Gas Sector Increases

### Analysis of Oil and Gas Publications and Patents

Oil and gas exploration and production is a multidisciplinary field that relies on devices, instruments, and materials developed in fields such as information technology, electronics, mechanics, and advanced materials. The overall field, “oil and gas,” as well as sub-topics, were defined in close consultation with KACST researchers and other KSA stakeholders.

The KSA oil and gas program identifies three sub-topics-petroleum geology, petroleum engineering, and geophysics-relevant to KSA strategic priorities. KACST researchers provided detailed lists of keyword terms that were used to develop search queries for publication and patent databases.<sup>1</sup> The scope of this study was restricted to only recent publication (2002-2006) and patent (2002-2006) activity in these fields.

There is general agreement that publications and patents strongly correlate with scientific research capacity, although publication and patent counts alone do not fully represent the quality or scope of research. Nonetheless, publication and patent activity have long been used as indicators for knowledge creation and research output.<sup>2</sup> Several indicators are presented below, including forward citations (the frequency at which publications and patents are cited by others), which is as a measure of impact, and co-authoring relationships, which are an indicator of scientific collaboration. Together, these indicators provide measures of collaboration, globalization, and the impact of science and technology research in fields related to the KSA oil and gas program.

---

1 ISI Web of Science and Delphion were queried for scientific publication and U.S. patent application data, respectively. The ISI Web of Science is a database of peer-reviewed articles in major scientific journals from around the world. Delphion is a searchable database of global patent activity, including the U.S. Patent and Trademark Office (USPTO). The USPTO is one of the world's major granters of patents and it has been argued that the U.S. market is so large that most important inventions from around the world are patented there.

2 Seminal research in the use of publications as a measure of scientific productivity includes A.J. Lotka, “The frequency distribution of scientific productivity,” *Journal of the Washington Academy of Sciences*, vol 16 (1926); D. Price, *Little Science, Big Science*, (New York: Columbia university Press, 1963); J.R. Cole and S Cole, *Social Stratification in Science*, (Chicago: The University of Chicago Press, 1973); J. Gaston, *The reward system in British and American science*, (New York: John Wiley (1978); and M.F. Fox, “Publication productivity among scientists: a critical review,” *Social Studies of Science*, vol 13, 1983.

### Global Oil and Gas Publication Activity

Between 2002 and 2006, there were 3523 articles published worldwide in oil and gas fields related to KSA oil and gas research priorities.<sup>3</sup> As shown in Figure 6, the United States was the world's largest producer of related

articles, generating 1137 articles over this time period. The United Kingdom was second, producing 428 articles followed by Canada and Italy with 307 and 258 articles respectively. Saudi Arabia was the 21st largest producer of publications, producing 33 articles.<sup>4</sup>

Figure 5: Oil and Gas Publication (2002-2006)

<sup>3</sup> Throughout this section, “oil and gas” refers only to the subset of oil and gas-related research defined by the KSA oil and gas program.

<sup>4</sup> A publication is assigned to a country if any of the publication’s author’s affiliations are located in that country. Because publications often have multiple authors, a single publication may be assigned to multiple countries. Aggregate figures, such as total global publication output, count each publication only once, but adding up sub-totals may yield a result larger than the reported total due to multiple counting.

As shown in table 2, Petroleum Geology accounts for more than half of oil and gas publications from 2002 to 2006, with Petroleum Engineering (889) and Geophysics (803) splitting the remainder.

Table 2: Oil and Gas Sub-Topics (2002-2006)

| Sub - Topic           | Publications |
|-----------------------|--------------|
| Petroleum Geology     | 1867         |
| Petroleum Engineering | 889          |
| Geophysics            | 803          |

### Benchmark Country Publication Impact

Average publication impact is calculated as the number of citations of articles from a particular country divided by the total number of articles published by authors from that country. For instance, a country that published 50 articles that were cited 100 times would have an average publication impact of two. Table 3 presents publication

and citation counts for benchmark countries.<sup>5</sup> Between 2002 and 2006, Australia had the highest average publication impact of all countries at 5.10 followed by Germany (4.71), and the United States (4.44). The average publication impact for Saudi Arabia was 0.61 with 20 citations of 33 articles.

<sup>5</sup> Benchmark countries include global leaders in terms of total petrochemical technologies publication output in addition to a list of specific countries provided by KACST. ISI Web of Science and Delphion were queried for scientific.

Table 3: Oil and Gas Publication Impact (2002-2006)

| Country         | Publications | Total Citations | Average Impact |
|-----------------|--------------|-----------------|----------------|
| Australia       | 150          | 765             | 5.10           |
| Germany         | 253          | 1191            | 4.71           |
| USA             | 1137         | 5049            | 4.44           |
| Netherlands     | 90           | 365             | 4.06           |
| New Zealand     | 100          | 392             | 3.92           |
| Spain           | 97           | 380             | 3.92           |
| Japan           | 131          | 512             | 3.91           |
| UK              | 428          | 1607            | 3.75           |
| Norway          | 123          | 432             | 3.51           |
| Canada          | 307          | 1043            | 3.40           |
| France          | 235          | 757             | 3.22           |
| Italy           | 258          | 730             | 2.83           |
| Peoples R China | 239          | 627             | 2.62           |
| Russia          | 182          | 260             | 1.43           |
| Saudi Arabia    | 33           | 20              | 0.61           |

### Oil and Gas Research Organizations

Oil and gas R&D publications are produced at more than a thousand research institutions in nearly 100 countries. As shown in table 4, the three institutions producing the largest number of publications related to oil and gas R&D are the Russian Academy of Sciences (131), Stanford University (94), and the University of Texas (79). In petroleum engineering, the top three organizations

are Stanford University, Institut Français du Pétrole (IFP) and University of Calgary. In geophysics, the top three organizations are the U.S. Geological Survey (USGS), the University of Texas, and the Russian Academy of Science. Finally, in geology, the top three organizations are the Russian Academy of Science, the Chinese Academy of Science and the USGS.

Table 4: Global Oil &amp; Gas R&amp;D Organizations (2002-2006)

| Organization                                | Publications | Total Citations | Average Impact | Geology | Petroleum Engineering | Geophysics |

| Heriot Watt Univ                            | 32           | 52              | 1.63           |         | 0                     | 0          |

### International Collaboration and Publication Impact

For countries with a similar level of publication activity, those with a high level of international collaboration also tend to produce publications with a high level of impact. In this study, international collaboration is calculated as the average number of countries represented per publication, based on authors' addresses. Figure 6 plots a country's level of international collaboration (horizontal axis) against the average impact of its publications (vertical axis). Australia, Germany and the Netherlands, which

show significant international collaborative activity, also tend to produce papers with a higher average impact.

### KSA Collaboration Activity

As shown in table 5, authors affiliated with KSA institutions collaborated on more than one article with authors from: the United States (5 publications) and France (2). KSA-affiliated authors collaborated on individual publications with authors from: Australia, Canada, Malaysia, Norway, UAE, and the United Kingdom.

Figure 6: Oil and Gas Collaboration and Publication Impact (2002-2006)

Table 5: KSA Publication Collaborators (2002-2006)

| Country              | Name of Publications |
|----------------------|----------------------|
| United States        | 5                    |
| France               | 2                    |

### Regional Publication Trends

The previous subsections examined publication data using a keyword-based approach. SRI International also performed an analysis of regional oil and gas publications using a journal based approach. For this

analysis, all articles in ISI-indexed journals related to oil and gas R&D were included. This analysis compared the number of oil and gas publications that are focused on three regions: the Arabian Gulf, the Gulf of Mexico, and the North Sea. The results are shown in Figure 7.

|                       | Arabian Gulf | North Sea   | Gulf of Mexico | Global         |
|-----------------------|--------------|-------------|----------------|----------------|
| Petroleum Engineering | 339          | 650         | 652            | 27.142         |
| Petroleum Geophysics  | 855          | 2638        | 3341           | 93.981         |
| <b>Total</b>          | <b>1194</b>  | <b>3288</b> | <b>3993</b>    | <b>121.123</b> |

Figure 7: Oil and Gas Publication Trends

Despite the fact that the Arabian Peninsula contains the majority of the world's oil reserves, oil and gas research, as measured by the number of publications, focuses less on the Arabian Gulf than on the North Sea and the Gulf of Mexico. This is particularly noticeable in the fields of petroleum geology and geophysics in which the Arabian Gulf produces less than one percent of global R&D publications.

The challenges in the Arabian Gulf region are as significant, if not more significant, than those faced by the Gulf of Mexico and North Sea. The relatively poor quality of seismic data and the highly fractured and complex reservoirs in the region pose major challenges. These challenges present opportunities for the Arabian

Gulf countries, and specifically Saudi Arabia, to develop new technologies.

### Oil and Gas Patent Activity

Between 2002 and 2006, there were 461 oil and gas related patent applications filed with the United States Patent Office. As shown in table 7, the majority of these (327) listed at least one inventor from the United States. Other countries with a significant number of inventors include: Japan (60 patents), the Netherlands (34 patents), and the United Kingdom (27 patents). Two oil and gas related patent applications listed an inventor from Saudi Arabia. These patent applications are not cited by any other patent applications.

Table 7: Oil and Gas Patents (2002-2006)

| Rank | Country           | Petroleum Engineering | Geophysics | Petroleum Geology | Total |
|------|-------------------|-----------------------|------------|-------------------|-------|
| 1    | United States     | 56                    | 240        | 31                | 327   |
| 2    | Japan             | 8                     | 51         | 1                 | 60    |

## Strategic Components

This strategy includes a vision, a mission, values, strategic objectives, and challenges. Together these components will guide the future of the local oil and gas R&D program.

---

### Vision

Achieving the technical competence and superiority to find and produce all the oil and natural gas resources in the Kingdom's territories.

### Mission

Creating an effective research and development environment for oil and natural gas exploration and production technologies through:

- An R&D infrastructure with qualified professionals.
- Policies and procedures facilitating the collaboration between research institutes (universities and industry).
- Localization and development of oil and natural gas exploration and production technologies to solve problems, improve quality, and reduce cost.

### Values

- Openness: open and shared information environment.
- Cooperation: exchange information and ideas through cooperative work.
- Humbleness: recognizing that what you have always requires improvement.
- Truth: delivering accurate and precise information.
- Dedication: to follow tasks to the end.
- Competition: the kind that promotes the work spirit and enthusiasm.

### Strategic Objectives

The following objectives were designed so that the KSA will be able to achieve the strategic vision and mission by 2025. Each objective is followed by a corresponding performance measure.

1. Improved data availability, openness, visualization, and access for research

- The availability of all acquired geological, geophysical and petroleum informations digitally with instant access.

2. Improved human resources quality, quantity, and education

- Increase in local Ph.D. holders in E&P disciplines by 1000 percent (or 1000).

3. Improve oil recovery and proven reserves

- Increase oil in place to 900 billion barrels and obtain a recovery rate of 70 percent by 2025 (Aramco objective).

4. Reduced exploration and production cost

- Reduce the cost of onshore barrel by 20 percent and offshore barrel by 50 percent.

5. Improve and increase efficiency of oil and natural gas exploration and drilling operations

- Cut the time needed for land acquisition and drilling operations by a 50 percent.

6. Reduced well pollution and emission

- No harmful pollutants emission from Red Sea wells and reduce emission from onshore and gulf wells to a minimum.

7. Complete the geological information needed for oil and gas upstream R&D

- Complete all missing petroleum geology information.

8. Development and localization of technology services for oil and gas

- The availability of at least 50 percent of the technology services (i.e. software) locally.

The performance measures were developed so that projects can be easily evaluated in regards to how they contribute to the strategic objectives.

### Challenges

The following is a list of some challenges identified by stakeholders:

- Education of young people on the importance of oil and gas technologies.

- Higher sulfur content in petroleum.

- High water-to-oil ratio.

- Slow information gathering, including survey and seismic acquisition in land.

- Seismic acquisition in areas covered with sand and characterized by near surface complexities and multiples.

- Reservoir characterization and monitoring.

- Data sharing and availability.

- Subsalt exploration and production.

- Drilling in deep water and old and complicated formations.

- Environmental and zero emission technologies.

- Identification, mapping, and understanding of source rocks and petroleum system in the region, including the Red Sea.

- Basement depth and mapping.

- Unayzah formation heterogeneity.

- Improved oil recovery.

- Exploration in new frontier areas such as the Red Sea and Rubaii alkhal.

- Mapping the top of large reservoirs.

- Detection and mapping of fractures in carbonate reservoirs.

- Deep inter-well resistivity measurements.

- In-situ wettability characterization.

- The problem of condensate banking in gas wells.

- Oily water disposal.

- Upstream waste management.

- Water down hole and online separation.

- Pore network modeling.

- Well monitoring systems.

- Well testing analysis in highly permeable layers.

- Sand production from unconsolidated formations.

- Dealing with reservoirs characterized with high salinity and temperature.

### Technology Target Areas

The oil and gas program, together with stakeholders, identified eight technology target areas (TTAs) that will be the focus of Saudi Arabian oil and gas R&D in the future. These technology targets were developed by identifying technology gaps in high-priority areas. The eight technology target areas and more focused secondary technology areas are listed below.

- An advanced and integrated database with high end visualization and communication tools for oil and gas information:
  - Development of data storage, compression, and monitoring capabilities (i.e. database).
  - Capabilities in data format upgrade and adaptation to our needs (i.e. new data formats).
  - Development of analysis, visualization, and integration tools (i.e. user interface).
  - Improved data accessibility through better communication and structure (i.e. internet access).
  - Advancements in data openness and sharing systems (i.e. access regulations).
- Completion of the petroleum geological information:
  - Mapping, modeling, and describing the sedimentary basement (i.e., improved gravity interpretation)
  - Better understanding and characterization of the petroleum systems including the source rock (i.e., seismic data interpretation).
  - Improved description of important and complicated formations including onaiyza formation (i.e., improved well information).
  - Improved fault and fracture description and direction in carbonate formations (i.e., azimuthal anisotropy).

## Technology Areas

- Completion of the geological maps and their integration and coherency (i.e., remote sensing interpretation).

### ■ Enhanced oil recovery (EOR):

- Improved injection and production systems in carbonate reservoir.
- Determine the proper enhance recovery methods for existing reservoirs.
- Reduce water-oil ratio.

### ■ Reservoir modeling, monitoring and management:

- Improved reservoir modeling and simulation (i.e. parallel simulation), modeling and simulation tools.
- Enhanced reservoir monitoring and attributes extraction (i.e. 4-D seismics, deep diagnostics and sensing).
- Enhancements in real-time and remote monitoring of changes in giant reservoirs (i.e. passive seismic, nanotechnology, wireless technology).
- Improved information and attribute integration for reservoir simulation (i.e. well-seismic integration), modeling and simulation input data.
- Fracture and fault detection and mapping in carbonate reservoir (i.e. azimuth anisotropy).

### ■ Improved oil and gas exploration success rates especially in the Rubaii Alkhali and the Red Sea:

- Improved efficiency and quality of land acquisition (i.e., land streamers).
- Solving near surface seismic problems (i.e., datuming and inversion).
- Solving seismic multiple related problems (i.e., full waveform inversion).
- Improved seismic imaging (i.e., prestack depth migration).
- Development of unconventional methods for exploration and data integration (i.e., remote sensing).

### ■ Oil and natural gas production:

- Solving the problem of gas condensate in producing wells.
- Oil and gas reservoir stimulation.
- Production free of pollutants.

### ■ Improved drilling operations (quality and efficiency):

- Reduce drilling cost and drilling completion through developing efficient drilling systems (i.e., new cutting methods and drilling fluids).
- Complete drilling and consequences monitoring systems (i.e., drilling sensors and advanced drilling components).

## Technology Areas

- Improved drilling in deep water and through formations in old and hard layers (i.e., ultra extended reach drilling).
- Improved drilling in high temperature, high pressure and high productivity formations.

### ■ Protecting the environment:

- Improved monitoring systems and methods for emission from wells (i.e., water real-time sensors).
- Enhanced production standards to avoid emission.
- Improved carbon dioxide capture, and sequestration.
- Production and injection related hazard assessment (i.e., passive seismic, InSAR).

The technology target areas were defined to provide guidance to those implementing the oil and gas strategic plan. Each technology target area includes an objective, a background and a description. The phases of implementation for a technology target area are:

- Theoretical development.
- Laboratory testing and modifications.
- Development/further development of equipment.
- Testing of prototypes.
- Qualification.
- Pilot/demonstration.

The time required to develop a technology target is estimated to be six to ten years. Therefore, secondary goals (technologies) have been identified under each technology target area. Where technology development is fairly advanced, the demonstration phase may be the only one remaining. Secondary goals can be developed considerably earlier, possibly within two years for some technologies.

The technology target areas have not been ranked by priority, but it is assumed that a plan of execution will contain criteria for ranking based on the contribution of each technology target to the strategic objectives.

Additionally, eight technology target teams will be formed comprised of three to five professionals from both industry and academia to draft a detailed

## Technology Areas

plan for each target area and to lead the technology development during the plan execution phase in these areas.

### Technology Initiatives and Priorities

The technology initiatives required to meet this plan's strategic objectives fall into two categories: technology prioritization and technology transfer.

### Technology Prioritization

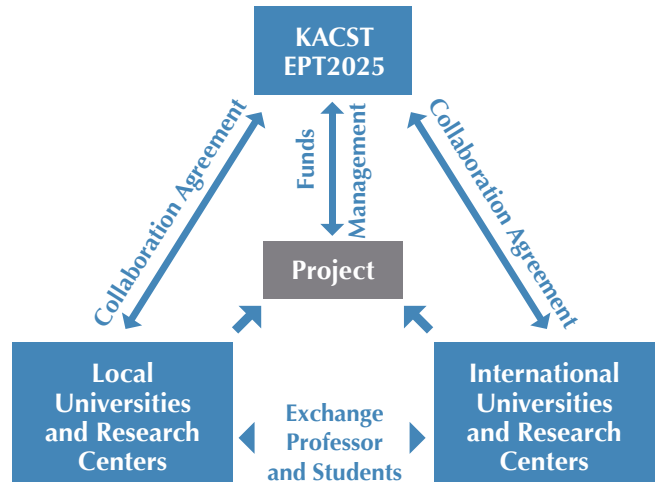

Following a model used by Saudi Aramco, technologies will be prioritized according to their compliance with the strategic objectives (impact), to their probability of success, and to their required resources. While Saudi Aramco's objectives are focused on oil in place and recovery, the objectives in this plan include elements related to enhancing local content. Therefore, the oil and gas program weighs the criteria with impact weighted more heavily than the probability of success and required resources as follows:

- Impact (50 percent).
- Probability of success (25 percent).
- Required resources (25 percent).

### Technology Transfer Models

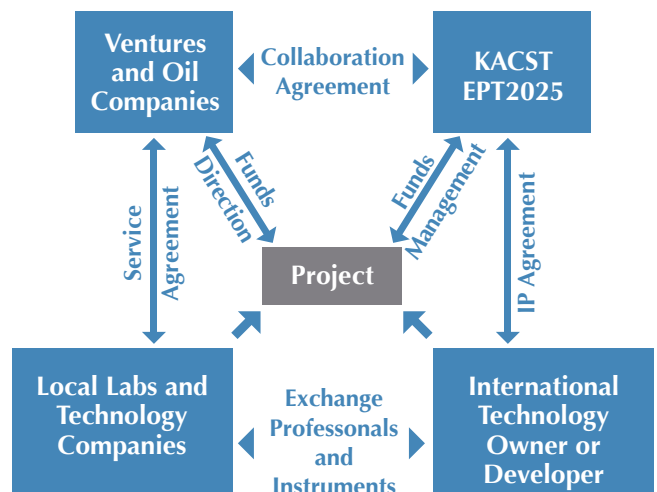

We use two models for technology transfer, both of which include the exchange of professionals and students between the technology owner or developer and a local entity. The first model applies to the case of transferring basic or applied research that is of strategic importance. The receiving party in this case is a local university or research center. In this model, KACST funds projects that allow Saudi graduate students and scientists to join international institutions. (Figure 8)

Figure 8: Basic/Applied Research Technology Transfer

The second model is concerned with transferring developed technologies or products that require minimal to moderate development for application locally. As a result, it includes an additional component corresponding to the end user. (Figure 9)

Figure 9: Developed Technologies/Products Technology Transfer

## Technology Areas

Like the first model, the project is managed and funded by KACST. However, there is also a collaboration agreement between KACST and the end user (e.g. Aramco, SRAK, TAQA). The end user may also contribute funds and provide direction for the project. In return, the end user gets a preferential service agreement that guarantees access to the developed product or service. An IP agreement is arranged between KACST and the international owner or developer of the technology,

which provides the local entity with the right to locally use and develop the technology.

### Key Technologies

Table 8 lists some specific technologies within each technology target area. The technologies and target areas in this table are not ranked but will be prioritized according to the methodology discussed previously.

Table 8: Technology Target Areas and Underlying Technologies

| Technology Target Area (TTA) |  | Technologies  |
|------------------------------|--|---|
| <b>TTA1 -</b>                | <b>An advanced and integrated database with high end visualization and communication tools for oil and gas information</b> |   |
| TTA1-1                       | Development of data storage, compression, and monitoring capabilities  | <ul style="list-style-type: none"> <li>■ Wavelet transform and wave packet technology</li> <li>■ Integrated Databases</li> </ul>  |

## Strategic Initiatives

This section describes the initiatives that will be undertaken to achieve the strategic objectives. These initiatives fall into seven categories: infrastructure, finance, human resources, coordination and cooperation, laws and regulations, strategic research trends, and localization. These were obtained based on the output of the conducted SWOT analysis (see appendix C).

### Infrastructure

This initiative will develop the KSA R&D infrastructure to support the strategic objectives by:

- Initiating new outstanding academic programs and developing current available ones (graduate and under-graduate programs).
- Establishing centers of excellence in universities and research institutes.
- Starting and supporting incubators that find and commercialize innovative technologies.
- Starting and developing advanced specialized laboratories.
- Constructing an organizational structure that will manage and guide R&D operations on the national level.
- Developing a national database for oil and gas exploration and production technical data to support R&D activities.

### Finance

There are two kinds of financial initiatives that will be undertaken. First, there are those that deal with how existing money is spent. Second, are those that deal with securing future funds.

#### Efficiently Using Existing Funds

Initiatives that deal with how existing money is distributed include:

- Utilizing current assigned budget in developing infrastructure (buildings,

laboratories, equipments, academic chairs...etc).

- Utilizing current assigned budget in the quantitative and qualitative development of human resources through recruitment, financial motivations, fellowships for students and researchers, and supporting training and qualification programs for the R&D staff.
- Supporting and funding activities that assist R&D activities (data bases, periodical meetings, workshops, societies...etc).

### Securing Future Funds

Initiatives that deal with securing future funds include:

- Proposing allocating part of foreign investments taxes in oil and gas industry to national R&D activities in the same field.
- Enhancing financial returns from studies and consultation that are provided to beneficiaries.
- Proposing a way to benefit from private grants and donations.
- Encouraging national mega companies that could benefit from R&D in oil and gas to take part in funding these activities.
- Securing continuous governmental funding.

### Human Resources

There are three types of human resources initiatives that will be undertaken. The first relates to filling current shortages by attracting foreign researchers. The second aims to attract local manpower over the medium term. The final type of initiative aims to improve educational opportunities for future researchers. Individual initiatives are listed by type below.

1. Compensating current shortages in research staff by attracting outstanding foreign researchers by:

- Providing an attractive research environment and financial motivations.
- Exploiting the conservative environment of the kingdom to attract regional researchers.
- Supporting academic programs and accepting foreign students in graduate studies
- Proposing amendments to immigration and foreign recruitment laws to eliminate any obstacles to attracting foreign researchers.

2. Attracting local manpower to oil and gas R&D activities by:

- Arranging educatory programs for talented students.

## Strategic Initiatives

- Providing financial awards for outstanding students in related academic fields.
- Approving a new attractive salary structure for researchers that ensure keeping outstanding staff from moving to another industry sector.
- Adopting new laws and regulations that ensure high quality R&D activities and providing financial incentives for outstanding researchers.
- Attracting local researchers from other fields (math, physics, and engineering) to participate in oil and gas R&D activities.
- Supporting current academic programs and starting new programs (in other universities).

### 3. Developing current and future human resources by:

- Providing enough scholarships for graduate students in local and international universities.
- Establishing specialized training programs for researchers and research assistants and technician.
- Providing fellowship for highly performing researchers in outstanding research institutes.
- Improving academic and graduate programs.

## Coordination and Cooperation

To ensure a successful R&D program, there has to be an effective system for coordination and cooperation between the industry and research sectors and between research entities themselves. The following two types of initiatives will be undertaken to achieve this.

- Coordination and cooperation among research entities:
  - Conducting joint research projects.
  - Exchange of experience and expertise.
  - Establishing periodic meetings, workshops and conferences.
  - Enhancing the role of current scientific societies and establishing new ones.

- Coordination and cooperation between industry and research sectors:

- Enhancing the established cooperation between the industry and some research institutes and encouraging the same for other institutes.
- Encouraging the industrial sector to participate in funding R&D activities.
- Exploiting the similarities in the gulf environment to promote cooperation of the industry and research sectors and to create a future market for R&D products in the gulf.
- Utilizing the presence and interest of international oil companies and laboratories in the region to establish an internal and external R&D alliance through which funds and profits are shared.

## Laws and Regulations

Initiatives will be undertaken that will propose amendments to laws and regulations that obstruct R&D activities related to:

- Researcher's salary structure.
- Immigration, foreign recruitment and foreigner salary structure.
- Performance evaluation and quality control.
- Rights and laws governing intellectual property.
- Industry support of local R&D activities through funds and information.
- Removal of unjustified or unnecessary confidentiality on technical data.

### Localization

This initiative will direct and concentrate localization efforts in:

- Technologies stated in the research trends.
- Services of a technology nature.
- Products.
- Knowledge and consultation capabilities.
- Advanced education and training capabilities.

### Exploration and Production Technologies 2025

Within KACST, a department will be created called the Saudi Exploration and Production Technologies 2025 (EPT2025) that will manage, oversee, revise, and organize the implementation of this strategy. EPT2025 will have a manager and a secretariat.

---

#### Mandate

EPT2025 will be a KACST department that facilitates innovation, technology development, technology transfer and research & development to solve existing problems, and improve the financial, environmental, and quality performance of the Saudi Arabian upstream oil and gas industry. EPT2025 will facilitate collaboration in all aspects of oil and gas R&D. EPT2025's role includes:

- Facilitating the localization and transfer of new technology for application in the Saudi upstream oil and gas industry.
- Acting as a matchmaker between those that have problems or opportunities and those that have potential technology or research solutions.
- Bringing stakeholders together to identify areas where technology or research will make a difference and launching specific projects to address those challenges.
- Promoting industry participation in the resulting initiatives and assisting with securing funding from a variety of sources.
- Providing a forum for the exchange of information and the creation of partnerships that are of mutual benefit to all involved and improve industry performance.
- Facilitating consensus for input to government on strategy and priorities regarding innovation, technology development and research in upstream oil and gas.

### Organization and Implementation of the Strategy

The strategy outlined in this document provides direction and focus. However, successful implementation of the technology strategy requires:

- Sufficient support in the industry and the public sector.
- A plan of action.
- Sufficient human and financial resources to implement proposed measures, and to follow up the strategy.
- A capable follow up structure.

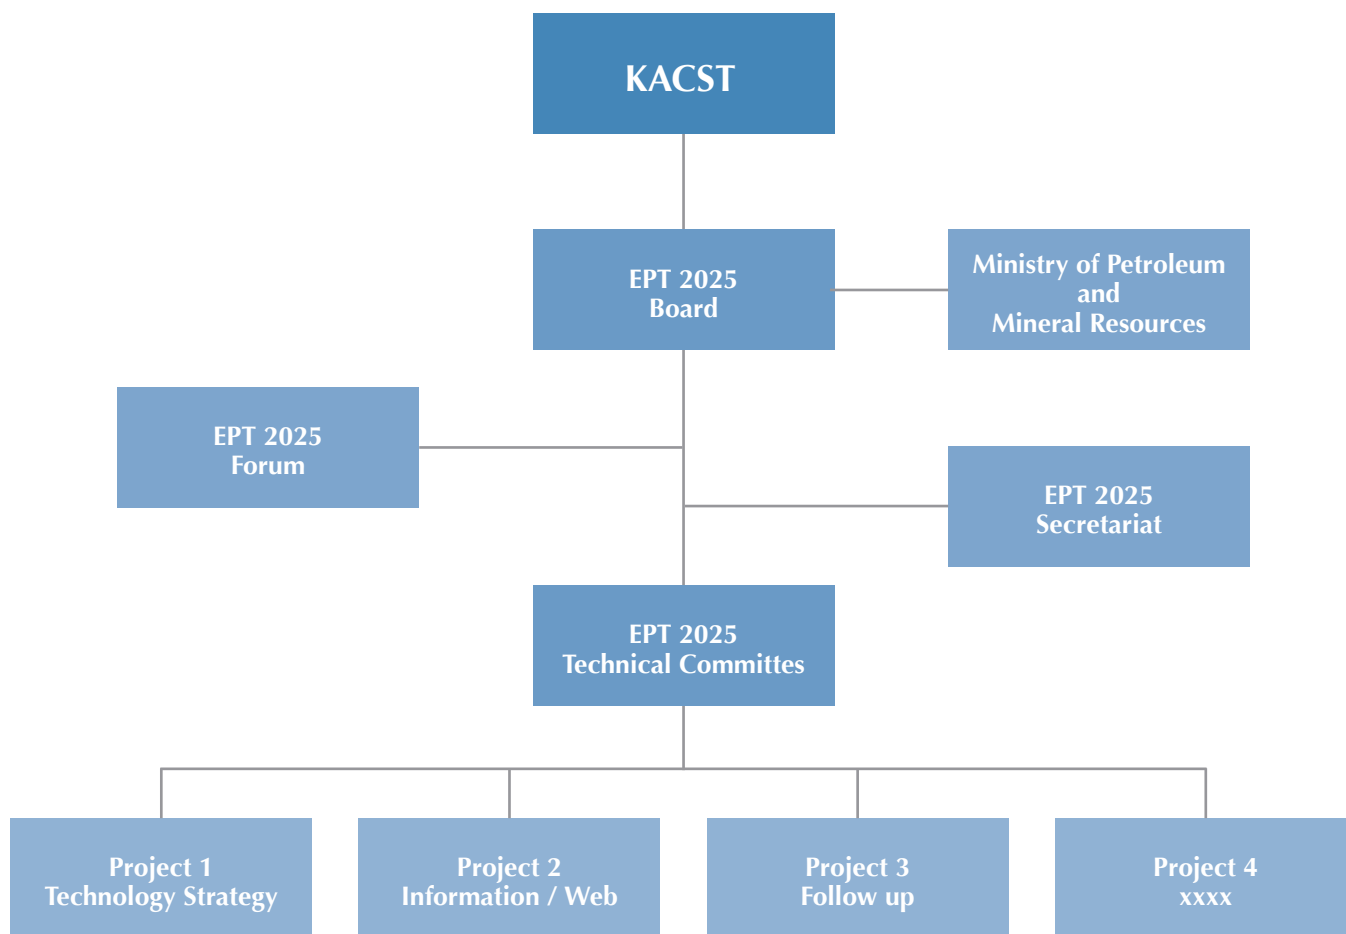

Thus, to implement this strategy, it is important to establish a single organization to develop and improve already

established networks (like those in the universities) and organizational structures (like that in Aramco). EPT2025 will link these structures, ensure cooperation, and provide overall coordination of technology development in the oil and gas sector to maximize return on investment.

#### Organization

EPT2025 will be organized through a secretariat/working group and a board that has a direct link to KACST. Its connection to the oil and gas sector will be through the EPT2025 Forum. A schematic form of the organization is illustrated in Figure 10.

Figure 10: Schematic Oil and Gas Organization

EPT2025 will serve as a catalyst for initiating R&D projects in time-critical areas with relevant participants from the sector.

### Implementation

EPT2025's implementation of the technology strategy will be aided by the strong support it enjoys among stakeholders. This support will be gathered by allowing a broad representation of stakeholders on the EPT2025 Board, and by allowing a comprehensive round of comments on drafts of this strategy document. KACST and MOPM resources will ensure top-level support from the oil companies.

The strategy will be introduced through the various research programs under the direction of KACST and through its use in the development of technology strategies by companies and universities. Publicity for the technology strategy and information about activities related to EPT2025 will primarily be disseminated through the website at <http://www.ognpksa.org>.

The stakeholders will work together to define secondary goals and plans under each technology target area and to identify in more detail the technology gaps and needs that can help achieve their overall objectives. Proposals for projects may be submitted by one or more research/academic institutes in co-operation with one or more oil companies to bridge the gap between academia and industry.

To achieve an efficient, powerful system for implementing and following up the strategy, and for EPT2025 to be more of significant contributor, it has been proposed that the major oil companies be responsible for co-ordinating one or more of the technology target areas. The oil companies would work with the EPT2025 secretariat, forming a core

group/technical committee. The participants in this core group will be responsible for:

- Surveying relevant technological developments in the areas in question, from strategic research to demonstration.
- Surveying the technology gaps and research needs in the area in consultation with the oil and gas sector.
- Drawing up action plans for technology development in the area.
- Initiating and promoting technology development projects in the area.
- Being a driving force behind the funding of relevant technology development projects.
- Keeping track of technological developments in the area, following up the strategy and informing relevant participants in the sector.
- Ensuring the co-ordination of overlapping activities, and exploiting synergies.
- Establishing and operating an electronic meeting place in the relevant area.

EPT2025 will provide strategic input to the program committees.

### Strategy Review

This strategy and corresponding implementation plans will be reviewed and updated annually. A comprehensive review will take place every five years. This update will require the same amount of effort needed to develop this initial strategy. Updates will be suggested and studied by the EPT2025 Forum and must be approved by the EPT2025 Board.

### Funding

Implementing the strategy described in this document will require considerable effort over a period of five to ten years. This will only be the beginning of long-term

efforts as it is expected that initiatives undertaken in this strategy will last beyond 2025. KACST, the oil companies, and the supplier industry must work together to support these efforts.

The formation of EPT2025 will allow existing oil and gas R&D funding to be used more effectively. However, more government funding is necessary as a catalyst to achieve the desired <push>. Without the government funding and incentives, it is doubtful that the industry will be able to develop technology fast enough to take advantage of the window of opportunity presented by the challenges in oil and gas R&D.

The supplier industry has fewer funds available for R&D investment than the oil companies due to lower profitability. At the same time, considerable technology development tasks should be transferred to the local supplier industry. As oil prices are high, local oil companies are executing larger and larger projects requiring quick supplier response, which increases the cost of supplier services. This creates an opportunity to develop technology enhanced local suppliers at a lower cost.

The local supplier industry has limited opportunities to strengthen its R&D efforts and should focus on enhancing its competitiveness. This is largely taking place today as markets and technological needs are shifting away from Saudi Arabian needs. The supplier industry cannot handle long-term R&D needs specific to the KSA. This strengthens the argument for doing research and development in supplier activities and to help develop these technologies for new supplier companies. Funding and guidance for this will be predominantly provided by the government through KACST. However, we envision that this strategy will also help direct funding that oil companies and other entities may wish to provide.

## Project Evaluation

Projects that support this strategy will be considered through a yearly request for proposals (RFP) that will be distributed and announced on the EPT2025 website every September. Proposals will be due in January of the following year. The technology target groups for each technology target area will develop the request for proposals for their relevant areas. The RFP should fit the vision and objectives developed for each technology target area.

The technology target groups will evaluate the received proposals. The evaluation will be based on how much each proposal contributes to the strategic objectives outlined in this document.

Table 9: Strategic Objectives, Technology Target Areas, and Stakeholder Support

| Type  | Objective   | Technology Target Areas | Stakeholder Support   |
|---|---|-------------------------|---|
| Data Availability and Access                    | The availability of all acquired geological, geophysical and Petroleum info digitally with instant access | 1                       | Ministry of Petroleum and Minerals, KACST, and the Saudi Geological society |
| Human Resources                                 | Increase in local Ph.D. holders in E&P disciplines by 1000 percent (or 1000)                              | All                     | EPT2025, KACST, the ministry of higher education, and universities          |
| Enhanced Oil Recovery                           | Increase Oil in place to 900 billion barrels and obtain a recovery rate of 70 percent by 2025             | 3, 4                    | EPT2025, Aramco, MoPM, and the universities                                 |
| Reduced Cost of Exploring and Production        | Reduce the cost of an onshore barrel by 20 percent and an offshore barrel by 50 percent                   | 3, 5                    | EPT2025, Aramco, service companies, and universities                        |
| Efficient and Improved Exploration and Drilling | Cut the time needed for land acquisition and drilling by a 50 percent                                     | 5, 7                    | EPT2025, Aramco, service companies, and universities                        |
| Reduced Well Pollution and Emissions            | Eliminate emissions from Red Sea wells and reduce emissions from onshore and gulf wells                   | 8                       | EPT2025, Aramco, MoMP, and universities                                     |
| Geological Information for Upstream R&D         | Complete all missing Petroleum geology information  | 1                       | EPT2025, MoMP, and universities   |
| Technology Services for Oil and Gas             | The availability of at least 50 percent of the technology (i.e. software) services locally                | All                     | EPT2025 and KACST   |

## Project Evaluation

As an example, three oil and gas projects were evaluated:

- Advanced Imaging dedicated to advanced processing and imaging of seismic data for better exploration and reservoir description. This project would help four potential scientists obtain their PhD in advanced imaging from abroad.
- A purely scientific project on Smart Fluids.

- Human development: a project to develop ten graduates in the field of petroleum geology.

The evaluation of these three projects with regards to each strategic objective is shown in Figure 11. Each of the three projects was weighted based on how much they contribute to each objective.

Figure 11: Example Evaluation of Three Projects with Regards to Strategic Objectives

## Final remarks

The development of this plan has been a joint effort with companies like Saudi Aramco, SRAK, LUKSAR providing significant contributions. This strategic plan will be followed by an implementation plan describing how to achieve the stated objectives. The plan will detail spending and project priorities as well as a structure for quality control and risk management.

Table A-1: Policy Related SWOT Analysis Table 1

| Strengths:   | Weaknesses:   |
|--|---|
| <ol style="list-style-type: none"> <li>1. The current availability of funds and support</li> <li>2. Increased focus on upstream R&amp;D strategic planning</li> <li>3. Underutilized local university professors in R&amp;D</li> </ol> | <ol style="list-style-type: none"> <li>1. Lack of long term funding commitment and well structured support for R&amp;D activities</li> <li>2. Lack of focus and direction</li> <li>3. Inefficient and insufficient infrastructure to support research activities</li> <li>4. Insufficient cooperation and coordination between involved sectors and researchers</li> <li>5. Shortage of qualified specialists (quality and quantity)</li> <li>6. Departure of scientists to better pay jobs (inside &amp; outside)</li> <li>7. Weak academic and research programs</li> <li>8. Shortage of young researchers and technicians</li> <li>9. Weak incentives for R&amp;D professionals</li> <li>10. Lack of accountability and quality control in R&amp;D activities</li> <li>11. Lack of international R&amp;D alliances</li> <li>12. Lack of technology incubators to transform innovations to commercial realities</li> <li>13. Nonexistent or insufficient number of centers of excellence</li> </ol> |

## Appendix A: SWOT Analysis

| Threats:   | Initiative # | Factors  | Initiative # | Factors                      |

|   |              |               |              | O14           |

## Appendix B: Proposed Organizational Structure

Figure B-1: Proposed Organizational Structure

## Appendix C: Strategic Initiatives Process

This appendix explains the process that was undertaken to develop the strategic initiatives. The process involved extracting primary initiatives after performing the SWOT analysis (Table A-1) and categorizing these initiatives

according to administrative themes (HR, coordination & cooperation, etc.). Primary initiatives were then rephrased in order to consolidate initiatives.

Table C-1: Strategic Initiative, SWOT, and Themes

| #  | S T                   | Initiative  | Themes                  |
|----|-----------------------|---|-------------------------|
| 1  | S1 S2 T5              | Utilizing current assigned budget to make plans for a sustainable funding   | Financial               |
| 2  | S1 S2 T6              | Providing financial and mental motivators to attract students to relevant fields of studies and developing a strategy to attract students   | Financial, HR           |
| 3  | S1 T7                 | Concentrating on long term researches and limiting funds of short term research to benefiting companies   | Financial, Coordination |
| 4  | S2 T1                 | Utilizing current interest in R&D and strategic planning to secure a continued future funding   | Financial               |
| 5  | S2 T2                 | Proposing the change of recruitment and procurement laws and regulations utilizing current interest in R&D strategic planning   | Laws                    |
| 6  | S1 S2 T3              | Utilizing financial funding and interest in R&D to establish a data base that support research activities   | Coordination            |
| 7  | S2 T8                 | Providing proposals that address intellectual property rights and enforcement   | Laws                    |
| 8  | S3 T4                 | Utilizing currently wasted manpower in the researchers sector to accomplish outstanding researches and increase the confidence in local researchers   | Laws, Coordination, HR  |
| #  | S O                   | Initiative  |                         |
| 9  | S1 S3 O4 O5 O6 O7 O12 | Utilizing current assigned funds and available manpower to benefit from available data in performing research projects in new frontier area exploration (onshore and offshore), gas exploration and enhanced recovery | Res. Trends             |
| 10 | S1 S2 O10 O13         | Utilizing current assigned funds to develop a detailed long term plan to exploit researchers from developing countries and those who want to live in the Kingdom  | HR, Laws                |
| 11 | S3 O11                | Exploiting the resemblance of geological conditions of the Gulf in conducting joint researches and creating a local future market for advanced E&P technologies   | Coordination            |

## Appendix C: Strategic Initiatives Process

| 12 | S1 S2 S3 O8<br>O9                          | Directing resources within a long term plan to produce advanced technologies that support increasing demands of oil industry   | Res. Trends                   |
|----|--|--|-------------------------------|
| #  | W O  | Initiative   |                               |
| 13 | W1 W3 W5<br>W8 W9 W12<br>W13 / O1 O2<br>O3 | Having oil and gas as the primary resource for the country and being the greatest producer and exporter in the world imply a greater concern in developing infra structure of R&D in oil and gas E&P (funding, HR, infrastructure) | Infrastructure, Financial, HR |
| 14 | W2/O4 O5<br>O6 O7                          | Directing researches towards exploration and production technologies in new frontier areas (Red Sea & Rub Alkhali) while concentrating on discovery of new fields and enhancing available ones                                     | Res. Trends                   |
| 15 | W2/ O8                                     | Exploiting current industry interest in applying state of the arts technologies to direct R&D activities to fill future demands of industry  | Res. Trends                   |
| 16 | W5 W6 W7<br>W8 / O10<br>O13                | Utilizing the attracting environment of the Kingdom to Muslims to attract outstanding researchers to support R&D and academic activities   | HR, Laws                      |
| 17 | W11 / O14                                  | Utilizing the stability of oil industry policy of the Kingdom in establishing international R&D alliance   | Coordination                  |
| 18 | W4 / O9                                    | Utilizing the current cooperation between the industry and specific research entities to enhance cooperation between research centers and researchers  | Coordination                  |
| 19 | W14 / O7                                   | Utilizing the presence of international gas ventures to enhance international cooperation in R&D activities  | Coordination                  |
| 20 | W12 W13 /<br>O8                            | Exploiting current industry interest in applying state of the arts technologies to establish excellent centers and incubators  | Coordination, Infrastructure  |
| #  | W T  | Initiative   |                               |
| 21 | W3 W5 W6<br>W7 W8 W9<br>W10/T2             | Proposing the amendments of laws and policies that obstruct developing scientific research as foreign recruitment and administrative laws  | Laws                          |
| 22 | W2 W7 / T3                                 | Re-evaluating the confidentiality of technical data in the industry to help in the formulation of the strategy and to enhance research and academic programs   | Coordination, Laws            |

## Appendix C: Strategic Initiatives Process

| 23 | W10 / T4           | Establishing standards for quality assurance in the research to gain more confidence from the industry in local R&D activities                               | Laws, HR               |
|----|--------------------|--|------------------------|
| 24 | W1 / T5            | Securing a sustainable and continued funding of the R&D sector mitigating the instability in oil prices  | Financial              |
| 25 | W11 W9 / T8        | Enhancing and enforcing IP laws to motivate researchers and cooperate with international entities  | Laws, Coordination, HR |
| 26 | W4 W12<br>W13 / T9 | Enhancing cooperative research activities to produce technologies that will break monopoly   | Coordination           |
| 27 | W2 / T11           | Directing R&D activities to environmentally friendly technologies. (CO <sub>2</sub> sequestration, waste water management... etc)                            | Res. Trends            |
| #  | OT                 | Initiative   |                        |
| 28 | O9/ T3 T4          | Utilizing the current cooperation between industry and specific research institutes to break down confidentiality and enhance confidence in local researches | Coordination           |

### Primary Initiatives

The following is the formulation of the initiatives after rephrasing:

#### Infrastructure

- Extracted from (20+13): Having oil and gas as the primary resource for the country and being the greatest producer and exporter in the world imply a greater concern in developing infrastructure of R&D in oil and gas E&P including:
  - Academic programs (graduate and undergraduate).
  - Excellence centers.
  - Incubators.
  - Well equipped laboratories.

#### Financial

- Extracted from (2+13): Utilizing current assigned funds to support R&D by:
  - Motivating researchers.
  - Fellowship and scholarship to students.
  - Equipping laboratories.
  - Funding high priority researches.
  - Training.
  - Funding academic programs (research chairs...etc).
- Extracted from (1+4+24): Making a plan for securing a sustainable funding through:
  - Available governmental funds.
  - Grants and donations.
  - Financial returns from studies and consultation that are provided to beneficiaries.
  - Foreign investments taxes in oil and gas industry.

#### Future Research Trends

- Extracted from (27+15+14+12+9): Directing researches and current and future resources through:
  - Coordination and cooperation with industry to define research trends.
  - Concentrate on technologies that suit our local conditions and needs.
  - Concentrate on non-traditional new frontiers (Red Sea and Rub Alkhali).
  - Gas exploration and production technologies.
  - Environmentally friendly technologies (CO<sub>2</sub> sequestration, waste water management...etc).

## Appendix C: Strategic Initiatives Process

### Human Resources

■ Extracted from (2): Enhance the enrolment of talent gifted students to academic fields related to oil and gas E&P technologies through:

- Arranging educatory and public awareness programs.
- Industry provided scholarship.
- Allocating enough opportunities of scholarship for graduate studies.
- Improving the salaries and compensations for researchers and R&D staff.

■ Extracted from (13): Utilizing available funds in developing HR through:

- Training and scholarship.
- Fellowship.
- Attracting salaries.
- Financially motivating outstanding researchers.

■ Extracted from (10+16): Compensate the shortage of manpower by foreign recruitment through:

- Amendment of recruitment laws.
- Good salaries and attracting research environment.
- Enhancing graduate studies in universities and providing seats for foreign students.

■ Extracted from (8+23): Establishing standard and regulations for R&D activities and exploiting wasted human resources by applying standards to control quality.

### Coordination and Cooperation

■ Extracted from (3): Coordination with industry in sharing the support of research.

■ Extracted from (6+22+28): Establishing a technical database that includes all information needed to support researchers while taking in account confidentiality of some information.

■ Extracted from (11+17+18+19+26+28): Establish local and international R&D alliance through which support and benefits are shared between all parties

through:

- Utilizing what currently is available of cooperation between industry and some research institutes and spreading the experience to other institutes.
- Exploiting the resemblance of research environment of the Gulf in conducting joint researches and creating a local future.
- Utilizing the presence and interest of international oil companies and laboratories in the region to establish an internal and external R&D alliance through which funds and profits are shared.

### Laws and Regulations

■ Extracted from (5+7+8+21+23+25): Proposing amendments of laws and regulations that obstruct R&D activities that are elated to recruitment:

- Immigration, foreign recruitment and foreigner salary structure.
- Performance evaluation and quality control.
- Procurement.
- Rights and laws governing intellectual property.
- Industry support of local R&D activities by funds and information and removal of unjustified or necessary confidentiality on technical data.

## Appendix D: Stakeholders and Participants

### Stakeholders

#### Private Sector

Table D-1: Private Sector Stakeholders

| Department                | Company  | Comments   |
|---------------------------|--|--|
| EXPEC-ARC                 | Saudi Aramco                                       | Dedicated to advanced research and development in exploration and production |

| Dhahran Carbonate Research Center | Schulumberger                               |

## Appendix D: Stakeholders and Participants

### Workshop Participants

- Dr. Salih Saner
- Dr. Ali Sahin
- Dr. Emad A. El-Sebakhy
- Dr. Abdulaziz M. Al-shaibani
- Dr. Abdullatif Abdulrahman Al-Shuhail
- Dr. Mustafa M. Hariri
- Dr. Tarek Sheltami
- Dr. Hasan Yousef Al-Yousef
- Dr. Hassan Salman Al-Hashim
- Dr. Muhammad Ali Al-Marhoun
- Dr. M. R. Awal
- Dr. Oguz Irtem
- Dr. Abdulwahab A. Abokhodair
- Dr. Adel Fawzy Douban
- Mr. Abdulmohsin Al Dulaijan
- Mohammed Badri
- Mr. Akhat Khakimov
- Abdulbari Arefi
- Mr. Abdulaziz S. Al-Issa
- Saud Al-Haluli
- Dr. Harry W. Mueller
- Dr. Dhafer A. Al-Shehri
- Sami Al-Neaim
- SUSHANTA MOHAPATRA
- Jan Erik Strand
- Dr. Tariq Alkhalifah
- Dr. Abdulaziz A. Al-Majed
- Dr. Emad S. El-Homadhi
- Dr. Abdulrahman Al-Quraishi
- Dr. Abdulaziz Ibn laboun
- Dr. Abdulaziz Kaabi
- Mr. Abdallah Alsabti
- Mr. Emad Al-Mushaigh

### Participants in SWOT Analysis Forum

- Mr. Moujahed Al-Husseini GEOARABIA, Dubai
- Dr. Adel Fawzy Douban KSU, Riyadh
- Dr. Abdullatif Al-Shuhail, KFUPM, Dhahran
- Dr. Adnan Alhashem,
- Dr. Hassan Salman Al-Hashim
- Dr. Mohammed Emera
- Mr. Abdulbari Arefi
- Dr. Ahmed Gawish
- Dr. Eissa Shokir
- Dr. Mohammed M. Amro
- Mr. Mohammed Badri, DRC, Dhahran
- Dr. Ali Sahin
- Mr. Yahya Shinawi, MOPM, Dhahran
- Mr. Saleh A. Al-Maghlouth, SSG, Khobar
- Mr. Abdulmohsin Al Dulaijan, SRAK, Khobar
- Mr. Claudio Bagaini, Schulmberger, UK
